Part 1: monday.com Demonstration

At monday.com, we help teams get more work done. We are the best AI work platform that empowers teams to automate, build, and scale their impact end-to-end with tools that actually execute the work for you. As an Implementation Consultant, you will lead implementation projects for monday.com customers, designing and building tailored solutions including configurations, automations, reporting, user management, and other advanced monday.com features and functionality.

Implementation Consultants are expected to be product experts of an ever expanding product. This demo task will be to see how you learn a complex product in a short amount of time and customize it to certain requirements. We are looking for a high-value, Minimum Viable Product (MVP) that demonstrates your architectural instincts and consultative approach.

Please create your own monday.com account by navigating to <https://monday.com> and signing up for your own 14-day trial. You will use this account to present your demo. No need for slides.

Interview Format: Your interview will last for 60 minutes. You will have 30 minutes to conduct a mock presentation of your workflow solution directly to the "customer". The remaining 30 minutes will be dedicated to Q&A, defending your architectural decisions, prototyping on the fly, and general interview questions.

Scenario (Customer Email):

Hi there,

I'm Pepper, Head of the PMO (Project Management Office) here at Stark Industries. We manage the rollout of internal strategic initiatives across IT, Operations, and HR. Honestly, our project pipeline is a mess right now. Department heads just email or message me asking for a "new software rollout" or a "process update," and we completely lose track. Half the time, the requests are vague—we don't even know the intended scope, budget, or which department needs to be involved until my team spends days chasing them down for details.

Once a project request comes in, we promise a 5-day SLA to evaluate, score, and officially approve or reject it. But right now, requests just sit around unreviewed. To make matters worse, I have a major visibility gap. I have to present to the executive steering committee every week to show them overall project health, timelines, and status. But my Project Managers need to see the actual day-to-day tasks, sprints, and milestones to do their jobs. I'm spending hours manually pulling task data from my PMs' spreadsheets into a PowerPoint just to give the executives a high-level summary. I need a system that gets our intake organized, keeps our project evaluations on track, and gives me my time back. I'm looking forward to seeing if monday.com can help us with this.

Thanks,
Pepper

Instructions and Guidelines: In your trial account, build a solution that addresses Pepper's challenges. As an Implementation Consultant, you must act as a trusted advisor and design sophisticated workflows within the monday.com platform to solve complex business cases.

To respect your time, please adhere to the following build guidelines:

- **PMO Portfolio Architecture & Executive Dashboard:** Build a connected, multi-tiered PMO solution consisting of the following specific deliverables:
 - **Centralized Intake Form:** Create a system to capture incoming, messy project requests directly into your workspace via a monday.com form.
 - **High-Level Portfolio Board:** Build a board specifically for Project Managers that acts as the strategic overview. This board must display key data fed upward from the projects living underneath it.
 - **Day-to-Day Project Board(s):** Create at least one tactical execution board underneath the Portfolio. This must be structured differently than the Portfolio, focusing strictly on the day-to-day tasks and sprints for the people doing the actual work.
 - **Executive Dashboard:** Build a standard monday.com Dashboard connected to your Portfolio. Include **3-4 widgets** that provide the high-level insights, overviews, and summaries Pepper needs for her steering committee meetings.

- **SLA Tracking:** Build a creative, out-of-the-box solution using Advanced Columns like Progress Tracking, Due Date, Formula (using functions), Timeline to visually track the 5-day SLA for evaluating new project requests.

To make this a truly automated, standardized PMO process, you will need to actively use the Connect Boards column and automations to link these tiers together.

Consultative Requirements:

- **Read Between the Lines:** Look for opportunities to answer questions the customer did not explicitly ask. Identify implicit bottlenecks in Pepper's vague email and build solutions for them.
- **AI-Assisted Workflow & Consulting:** A core competency of the modern Implementation Consultant is leveraging AI tools to accelerate solution delivery and solve complex logic problems. Throughout your preparation:
 - **Native monday AI:** Pepper mentioned that incoming requests are often vague and lack key details like scope or department. Incorporate a native monday AI feature (e.g., AI columns, automated AI categorization, or AI summarization) directly into your intake or portfolio workflow to automatically process or structure these messy requests.
 - **External AI Usage:** We actively encourage you to use tools like ChatGPT, Claude, or others to assist in your build. You might use them to brainstorm your relational architecture, write the complex formula for your SLA tracking, or generate realistic mock data to populate your boards.
 - **Document your Strategy:** Keep notes on how you used AI tools. During the interview, we will ask you to walk through specific examples of how AI helped you—including the prompts you used, how you iterated on the results, and where AI was most or least effective. This isn't about proving you can do it "without AI"; we want to see that you can effectively leverage these tools as a modern consultant.

Part 2: Discussion and Building

In this role, you will train, advise and consult with customers. During the final 30 minutes of your interview, be prepared to clearly articulate technical topics to a non-technical audience. We will treat this as a working session, so please come ready to:

- Share your "AI Stack" with the panel. Walk us through how you leveraged external AI tools to accelerate your build and explain how your native monday AI setup specifically solves Pepper's unstructured data problem.
- Be prepared for your customer to challenge your build or ask for things that were not explicit in the request email. We want to see how you consultatively handle objections, take initiative, and adapt by prototyping solutions live in the platform.

Feel free to reach out if you have any questions.

Good luck from the monday.com team!
